

Concrib Offers a Choice –

Maximising Land Values

Concrib concrete sleeper retaining walls have mostly been constructed using our reinforced concrete piers, with the sleeper beams placed behind the piers to complete the system. This offers an attractive economical wall system.

In some circumstances it is desirable to have the front face of the retaining wall to be coincident with a property boundary. To address this possibility Concrib can offer our system utilizing hot-dipped galvanized columns in place of the concrete piers. This treatment gives a flush finish as well as the ability to extend the columns above the top of the wall, thereby enabling acoustic fencing to be incorporated if required.

Concrib Sleeper walls look good, last a lifetime, never rot or warp and are termite free !!
